

Exact wave-function formulation for completely free annular sector plates

Seok-Tiersten boundary determinant extended to FFFF · spurious zeros discriminated, not ignored

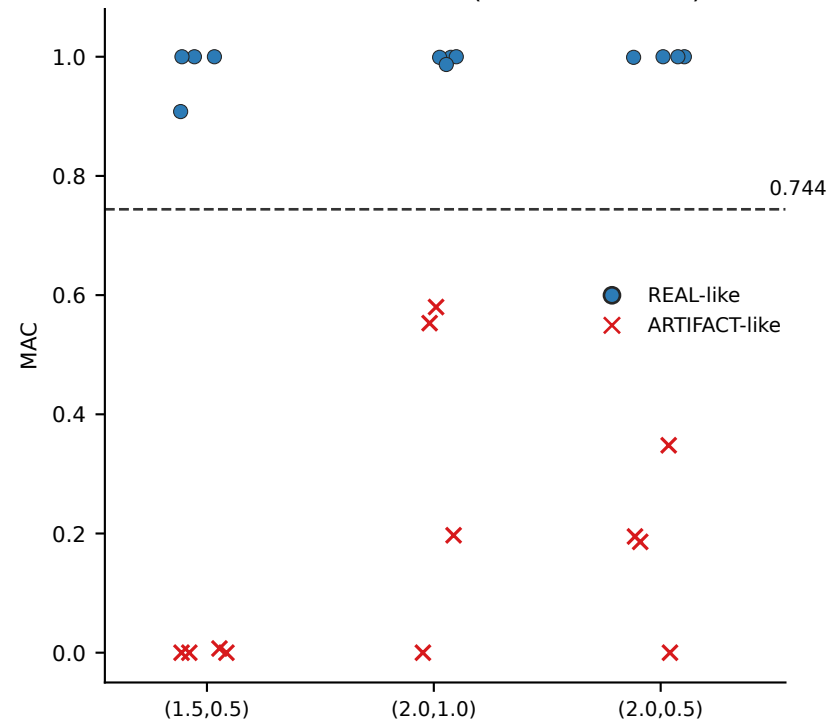

Completely free annular sector

Flexural residual screen (portable)

Extensional MAC bar (threshold 0.744)

Flexure: two-sided residual screen, FE 0.64% (isotropic) / 1.08% (orthotropic), 6 of 6 literature targets at a third geometry.

Extension: 26 solver roots covering 27 FE modes (worst unique-partner 0.052%); MAC bar classifies 24 calibration candidates and all 24 sweep keys; two independent semi-analytical tables.
